

Bird Species Observation

Buisness Insights

Habitat Insights

- Forest has **higher bird population and diversity**
 - Grassland supports fewer but specialized species
-

Time Insights

- Peak activity during **morning**
 - Seasonal variation observed across months
-

Environmental Insights

- Temperature and weather influence bird sightings
 - Clear/moderate weather → higher observations
-

Species Insights

- Few species dominate observations
 - Some species are habitat-specific
-

Behavior Insights

- Most birds identified via **sound (singing/calling)**
 - Limited flyover observations
-

Conservation Insights

- Presence of **watchlist species**

- Some regions require protection

-- Additional Business Insights --

● 1. Which habitat has more birds?

Answer:

Forest habitats show higher bird observations compared to grasslands.

Insight:

Forests provide richer resources (food, shelter), leading to higher bird activity.

● 2. Which habitat has higher species diversity?

Answer:

Forests have a greater number of unique species.

Insight:

Forest ecosystems support more biodiversity due to varied vegetation.

● 3. Which locations are biodiversity hotspots?

Answer:

Certain administrative units (e.g., top-count locations) show significantly higher bird observations.

Insight:

These areas are ideal for:

- Conservation efforts
 - Bird-watching tourism
-

● 4. What are the most common bird species?

Answer:

A few species dominate the observations (Top 10 species).

Insight:

These species are highly adaptable and widespread.

● 5. Which species prefer which habitat?

Answer:

Some species are predominantly found in:

- Forest → dense vegetation species
- Grassland → open-area species

Insight:

Species have strong habitat preferences.

● 6. When are birds most active?

Answer:

Bird activity peaks during:

-  Morning hours

Insight:

Birds are more active during feeding and vocal periods.

● 7. How does weather affect bird activity?

Answer:

- Moderate temperature → higher activity
- Extreme conditions → lower sightings

Insight:

Weather directly influences bird visibility and behavior.

● 8. What are common bird behaviors?

Answer:

Most birds are identified via:

- Singing
- Calling

Insight:

Acoustic detection is the primary observation method.

● 9. How far are birds typically observed?

Answer:

Most birds are observed within shorter distances.

Insight:

Birds tend to stay within localized habitats.

● 10. Are there any at-risk species?

Answer:

Yes, some species fall under the **watchlist category**.

Insight:

These require conservation focus.
